

PEDAL OPERATED SEMI-AUTOMATIC EYELETING MACHINE

MI

The MI machine is a semi automatic machine which feeds an eyelet by means of a hopper fed raceway.

The machine punches a hole and sets the eyelet in one operation. If a washer is used this is placed by hand. The MI machine is available in manual, electric or pneumatic versions. The powered versions of the machine are supplied with all necessary safety guarding.

It is suitable for eyelet sizes with hole of up to 9mm when closed (size 24 Sail and No 0 Grommet).

The machine can also be supplied with different feed equipment which is quick and easy to change making the machine extremely versatile.

A non punching version is also available where the hole in the application is pre formed.

Specification
